

On 2/7/21 skiers in Beehive reported: "Numerous large collapses, ECTP in several pits on mid-pack facets, and triggered a test slope remotely from flat terrain. It broke in the old snow, but towards to top, maybe 10cm below the interface with the last week's snow. Propagated over 50m, crown depth 60-100 cm. Would be solid size 2 if the slope wasn't 20m tall." Photo: Sam H.
