

stable in lick creek

Date

Tue, 03/22/2022 - 07:30

Activity

Skiing

Firm wind / sun crust on most West and South facing aspects - 1 - 2" thick

Backside of Lick Creek Ridge skied very well, still evidence of the avalanche that you triggered under the cornice, but 3 - 4 tracks had sent that cornice since the last storm cycle with a couple making unfortunate hard sweeping RH turns on that steep section with no additional sluff or fracture visible. Minimal wind transport on that side.

Region

Northern Gallatin

Location (from list)

Lick Creek

Observer Name

Bill Schell
