

Spring Conditions in Beehive Basin

Date

Sat, 05/25/2024 - 12:55

Activity

Snowboarding

Toured into Beehive Basin today. The added snow from the storm this week made quite a difference in coverage (which was already still really good) and it looks like the middle of winter up there. Temps were warm and the snowpack felt homogenous and stable. Planned to ski peak 10602 but we noticed some wind loading and weather coming in so we toured up and around climbers left of the prow and skied down the climbers right side of it. Skinning in we saw a lot of wet loose avalanche debris and a couple slides that looked like they slid a couple days ago from the last storm. We heard multiple slides coming off of rocks and watched a cornice break off climbers left of 4th of July Couloir. We also saw some wet loose debris that slid on 10602 on our way out of the basin. By 10am it was very warm and the snow was wet, sticky and heavy.

Region

Northern Gallatin

Location (from list)

Beehive Basin
