

Just over 3 ft of settled snow as of November 16th can be found in the Bridger Range immediately north of Bridger Bowl. The main layer of concern is a combination of graupel crystals and heavily rimed, new snow crystals. A slightly denser layer of snow rests on top. These two layers are easy to find and will easily produce an avalanche if loaded by wind blown snow.

Advisory Region

Bridger Range

Longitude

-110.93W

Latitude

45.83N
